

Guidelines for proposals

1. Concentrate on the algorithmic challenges
2. Create figures to explain your idea, algorithm, workflow etc.
3. Be specific about:
 - a. the experiments you will perform and/or the data you will use
 - b. your assumptions and/or your central hypothesis
4. Elaborate on the testing/validation of your envisioned results
5. The proposal should be self-contained:
 - a. refer to other papers, but it should not be necessary to read these
 - b. describe these papers not at the algorithmic level, but summarise and focus on the basis
6. Read your own proposal (or have someone read it) critically, try to find the weak spots
